ONTOLOGICAL REPRESENTATION + SBGN PROGRESS

Accessing Semantic Information

- SBO + Miriam Web Services as well as KEGG / ChEBI / OntologyQuery are available to Modules of the Systems Biology Workbench
- One (C#)library / SBW module, provides querying, as well as centralized caching to other modules
- Thus all programming languages can now access those features.

Displaying Information

Need Exchange Format

- ◎ If we still seriously think about a 'libSBGN', with:
 - support for multiple model exchange languages
 - support for automated VALIDATION of a map
 - semi-automated Translation between graph types
 - auto layout routines
- ◎ Need Exchange Format

Example

- Our tools use the SBML Layout / Render Extension to actually store position / dimensions + glyphs. Which is sufficient for us to exchange maps between tools.
- Render Extension Style sheet, which can be applied to SBML Layout based on SBO terms.

Style Sheet

Transition SBO:0000167

Associaton SBO:0000177

Disassociaton SBO:0000180

Style Sheet

Unspecified Entity: SBO:0000285

Simple Chemical: SBO:0000247

Macromolecule: SBO:0000245

Genetic Entity: SBO:0000354

Multimer: SBO:0000286

Source / Sink: SBO:0000291

Perturbation: SBO:0000357

Observable: SBO:0000358

Tag

Clonemarker

Style Sheet

Complex: SBO:0000253

Compartment: SBO:0000289

More Clonemarkers

However

- ⦿ Layout + RenderExtension do not make it possible to **VALIDATE** a given map
 - For that we need to store the actual graph

Problems (?)

- ⦿ Some glyphs will never be (automatically) assigned:
 - Logical Operators,
 - Tag, Logic arc, Equivalence arc, aubmap
 - Omitted / unknown process
 - They are available in Athena, but probably not in the automated viewer.
- ⦿ No support for the submap feature with automated collapsing as indicated by the SBGN spec, for that we wait for Sarah ☺
