## The CellML Namespaces

Author:

Warren Hedley (Bioengineering Institute, University of Auckland)

### 1 Introduction

The research into metadata revealed a number of different styles for defining namespace URIs. In particular, I quite liked the style proposed in the [Dublin Core in XML](#)<sup>1</sup> proposal, where a version number is included in the namespace URI. There are arguments for and against, which I may have time to write about at some point.

In the meantime, the interested reader can have a browse through the [thread I started](#)<sup>2</sup> on [XML-DEV](#)<sup>3</sup> on this topic
